Semester: (Spring,Year:2025),B.Sc.in CSE (Day)

LAB REPORT NO - 01
Course Title: Data Communication
Course Code: CSE307   Section:223-D5

Lab Experiment Name : Implementing Byte (Character) Stuffing

and De-stuffing

Student Details

Name	ID
1. MD.SHAJALAL	223002088

Lab Date   : 24 - 02 - 2025
Submission Date   : 03 – 03 - 2025
Course Teacher's Name   :   Md.Samin Hossain Utsho

Lab Report Status	
Marks: ……………………………	Signature:.....................
Comments:.................................	Date:.............................

1. TITLE OF THE LAB REPOT EXPERIMENT

Implementing Byte (Character) Stuffing and De-stuffing

2. Objective :

The objective of this experiment is to implement Byte (Character) Stuffing and De-Stuffing in a programming language (C) and demonstrate how the technique ensures reliable data transmission.

3.Byte Stuffing Algorithm:

1. Define a **flag** character that marks the start and end of a frame.
2. Define an **escape** character to be used for stuffing.
3. Traverse the data string:
    - If a character matches the flag or escape character, prepend it with the escape character.
    - Otherwise, append it normally.
4. Add the flag at the beginning and end of the frame.
5. Return the stuffed data.

4.Byte De-Stuffing Algorithm:

1. Ensure the received frame starts and ends with the flag character.
2. Remove the flag characters from the start and end.
3. Traverse the data:
    - If an escape character is encountered, skip it and append the next character.
    - Otherwise, append the character normally.
4. Return the de-stuffed data.

5. Implementation (C Code) :

```c
#include <stdio.h>
#include <string.h>
#define FLAG 'F'
#define ESC 'E'

void byte_stuffing(char *data, char *stuffed) {
    int j = 0;
    stuffed[j++] = FLAG;
    for (int i = 0; i < strlen(data); i++) {
        if (data[i] == FLAG || data[i] == ESC) {
            stuffed[j++] = ESC;
        }
        stuffed[j++] = data[i];
    }
    stuffed[j++] = FLAG;
    stuffed[j] = '\0';
}

void byte_de_stuffing(char *stuffed, char *destuffed) {
    int j = 0;
    for (int i = 1; i < strlen(stuffed) - 1; i++) {
        if (stuffed[i] == ESC) {
            i++;
        }
        destuffed[j++] = stuffed[i];
    }
    destuffed[j] = '\0';
}

int main() {
    char data[] = "ABCFDEF";
    char stuffed[50], destuffed[50];

    byte_stuffing(data, stuffed);
    printf("Stuffed Data: %s\n", stuffed);

    byte_de_stuffing(stuffed, destuffed);
    printf("De-Stuffed Data: %s\n", destuffed);

    return 0;
}
```

6.Program Output:

```
OUTPUT     ...        Filter                                          Code

[Running] cd "c:\Users\mdsha\" && gcc so.c -o so && "c:\Users\mdsha\"so
Stuffed Data: FABCEFDEEEFF
De-Stuffed Data: ABCFDEF

[Done] exited with code=0 in 0.954 seconds
```

6. Conclusion : Byte Stuffing and De-Stuffing are essential techniques in data transmission to handle special control characters within a message. This experiment successfully implemented both stuffing and de-stuffing in C, ensuring that data integrity is maintained during transmission. The output confirms the correctness of the algorithm.
